

REGISTERED DDR SDRAM DIMM

D21RB12P – 512MB
D27RB12P – 512MB

For the latest data sheet, please visit the Super Talent Electronics web site: www.supertalentmemory.com

Features

- 184-pin, dual in-line memory modules (DIMM)
- Fast data transfer rates: PC2100 and PC2700
- ECC, 1 bit error detection and correction
- Registered inputs with one-clock delay
- Phase-lock loop (PLL) clock driver to reduce loading
- Utilizes 266 MT/s and 333MT/s DDR SDRAM components
- 512MB (64 Meg x 72)
- VDD= VDDQ= +2.5V
- VDDSPD = +2.3V to +3.6V
- 2.5V I/O (SSTL_2 compatible)
- Commands entered on each positive CK edge
- DQS edge-aligned with data for READs; centraligned with data for WRITEs
- Internal, pipelined double data rate (DDR) architecture; two data accesses per clock cycle
- Bidirectional data strobe (DQS) transmitted/received with data, i.e., source-synchronous data capture
- Differential clock inputs (CK and CK#)
- Four internal device banks for concurrent operation
- Programmable burst lengths: 2, 4, or 8
- Auto precharge option
- Auto Refresh and Self Refresh Modes
- 7.8125µs (512MB) maximum average periodic refresh interval
- Serial Presence-Detect (SPD) with EEPROM
- Programmable READ CAS latency
- Gold edge contacts

Note:

1. Pin 115 is A12 for 512MB.
2. Pin 167 is NC for 512MB.

**Figure 2:
Pin
Locations**

Table 4: Pin Descriptions

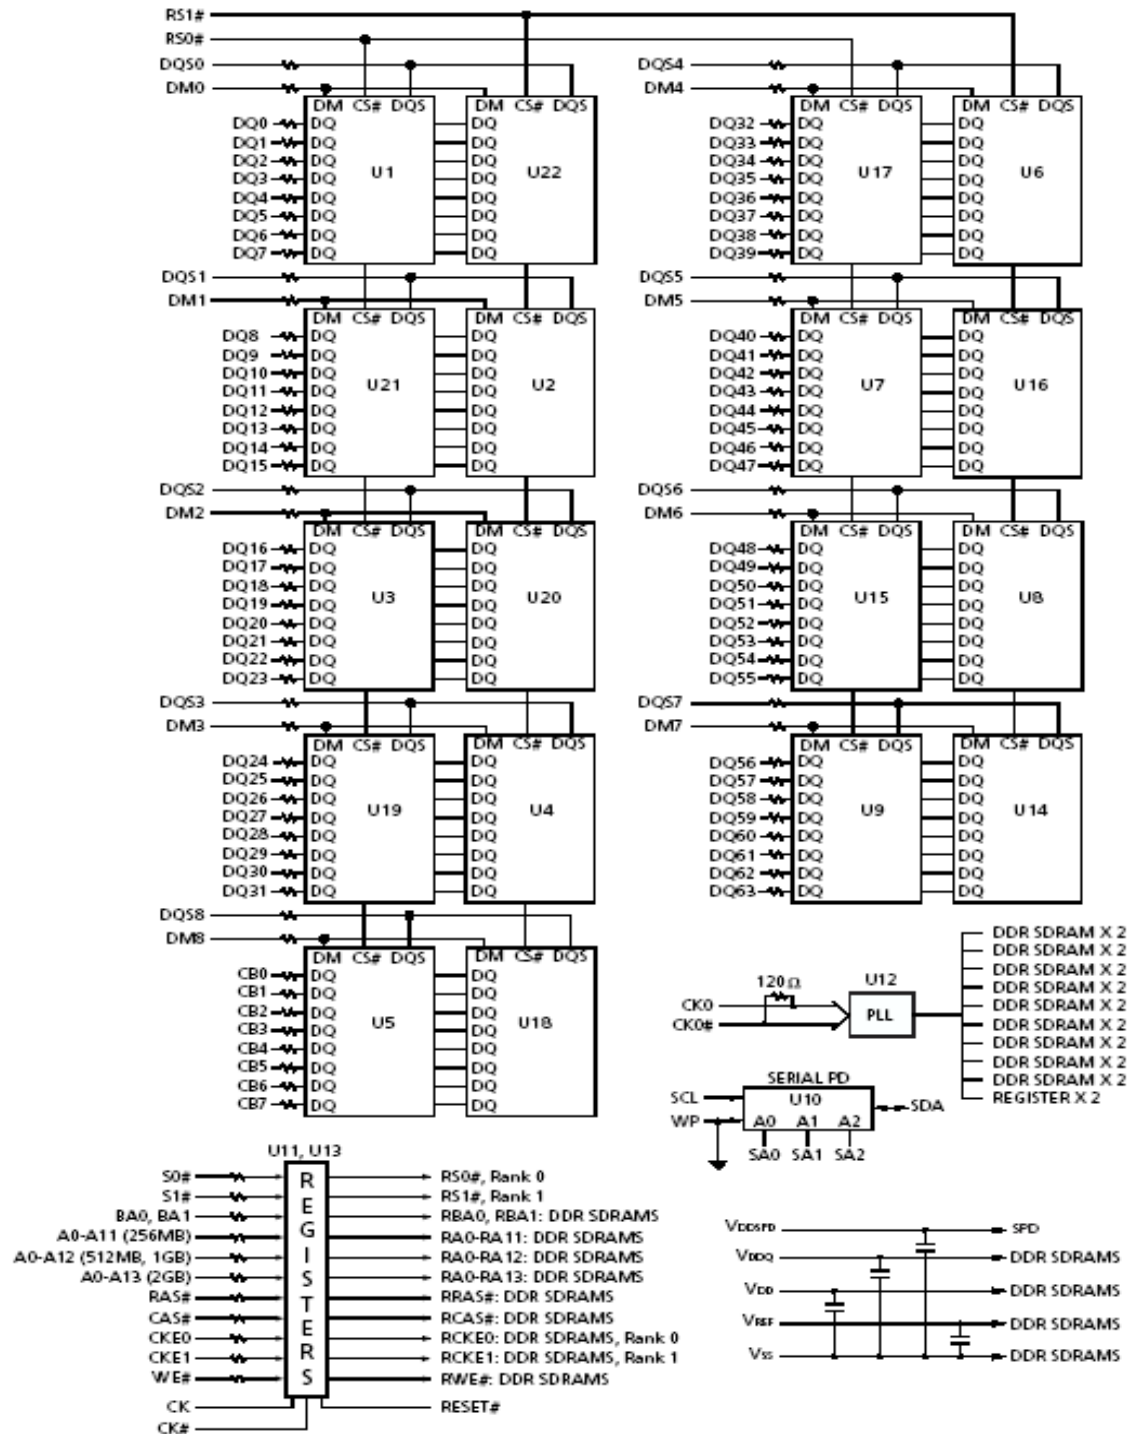

Pin numbers may not necessarily correlate with symbols. Refer to Pin Assignment tables on page 3 for more information.

PIN NUMBERS	SYMBOL	TYPE	DESCRIPTION
10	RESET#	Input	Asynchronously forces all register outputs LOW when RESET# is LOW. This signal can be used during power-up to ensure CKE is LOW and SDRAM DQ is High-Z.
63, 65, 154	WE#, CAS#, RAS#	Input	Command Inputs: RAS#, CAS#, and WE# (along with S#) define the command being entered.
137, 138	CK0, CK0#	Input	Clock: CK and CK# are differential clock inputs. All address and control input signals are sampled on the crossing of the positive edge of CK and negative edge of CK#. Output data (DQs and DQS) is referenced to the crossings of CK and CK#.
21, 111	CKE0–CKE1	Input	Clock Enable: CKE HIGH activates and CKE LOW deactivates the internal clock, input buffers, and output drivers. Taking CKE LOW provides PRECHARGE POWER-DOWN and SELF REFRESH operations (all device banks idle), or ACTIVE POWER-DOWN (row ACTIVE in any device bank). CKE is synchronous for POWER-DOWN entry and exit, and for SELF REFRESH entry. CKE is asynchronous for SELF REFRESH exit and for disabling the outputs. CKE must be maintained HIGH throughout read and write accesses. Input buffers (excluding CK, CK# and CKE) are disabled during POWER-DOWN. Input buffers (excluding CKE) are disabled during SELF REFRESH. CKE is an SSTL_2 input but will detect an LVCMOS LOW level after V _{DD} is applied and until CKE is first brought HIGH. After CKE is brought HIGH, it becomes an SSTL_2 input only.
157, 158	S0#–S1#	Input	Chip Select: S# enables (registered LOW) and disables (registered HIGH) the command decoder. All commands are masked when S# is registered HIGH. S# is considered part of the command code.
52, 59	BA0, BA1	Input	Bank Address: BA0 and BA1 define to which device bank an ACTIVE, READ, WRITE, or PRECHARGE command is being applied.
27, 29, 32, 37, 41, 43, 48, 115 (A12), 118, 122, 125, 130, 141, 167 (A13)	A0–A11 (256MB) A0–A12 (512MB, 1GB) A0–A13 (2GB)	Input	Address Inputs: Provide the row address for ACTIVE commands, and the column address and auto precharge bit (A10) for READ/WRITE commands, to select one location out of the memory array in the respective device bank. A10 sampled during a PRECHARGE command determines whether the PRECHARGE applies to one device bank (A10 LOW, device bank selected by BA0, BA1) or all device banks (A10 HIGH). The address inputs also provide the opcode during a MODE REGISTER SET command. BA0 and BA1 define which mode register (mode register or extended mode register) is loaded during the LOAD MODE REGISTER command.
5, 14, 25, 36, 47, 56, 67, 78, 86, 97, 107, 119, 129, 140, 149, 159, 169, 177	DQS0–DQS17	Input/Output	Data Strobe: DQS0–DQS8, Output with READ data, input with WRITE data. DQS is edge-aligned with READ data, centered in WRITE data. Used to capture data. Data Mask: DQS9–DQS17 function as DM0–DM8 to mask WRITE data when HIGH.
44, 45, 49, 51, 134, 135, 142, 144	CB0–CB7	Input/Output	Data I/Os: Check bits.

**Table 5: Pin Descriptions**

Pin numbers may not necessarily correlate with symbols. Refer to Pin Assignment tables on page 3 for more information.

PIN NUMBERS	SYMBOL	TYPE	DESCRIPTION
2, 4, 6, 8, 12, 13, 19, 20, 23, 24, 28, 31, 33, 35, 39, 40, 53, 55, 57, 60, 61, 64, 68, 69, 72, 73, 79, 80, 83, 84, 87, 88, 94, 95, 98, 99, 105, 106, 109, 110, 114, 117, 121, 123, 126, 127, 131, 133, 146, 147, 150, 151, 153, 155, 161, 162, 165, 166, 170, 171, 174, 175, 178, 179	DQ0–DQ63	Input/Output	Data I/Os: Data bus.
92	SCL	Input	Serial Clock for Presence-Detect: SCL is used to synchronize the presence-detect data transfer to and from the module.
181, 182, 183	SA0–SA2	Input	Presence-Detect Address Inputs: These pins are used to configure the presence-detect device.
91	SDA	Input/Output	Serial Presence-Detect Data: SDA is a bidirectional pin used to transfer addresses and data into and out of the presence-detect portion of the module.
1	VREF	Input	SSTL_2 reference voltage.
15, 22, 30, 54, 62, 77, 96, 104, 112, 128, 136, 143, 156, 164, 172, 180	VDDQ	Supply	DQ Power Supply: +2.5V ±0.2V.
7, 38, 46, 70, 85, 108, 120, 148, 168	VDD	Supply	Power Supply: +2.5V ±0.2V.
3, 11, 18, 26, 34, 42, 50, 58, 66, 74, 81, 89, 93, 100, 116, 124, 132, 139, 145, 152, 160, 176	VSS	Supply	Ground.
184	VDDSPD	Supply	Serial EEPROM positive power supply: +2.3V to +3.6V.
9, 71, 82, 90, 101, 102, 103, 113, 115 (256MB), 163, 167 (256MB, 512MB, 1GB), 173	NC	–	No Connect: These pins should be left unconnected.
16, 17, 75, 76	DNU	–	Do Not Use: These pins are not connected on this module but are assigned pins on other modules in this product family.

Figure 3: Functional Block Diagram

Note:

1. All resistor values are 22Ω unless otherwise specified.

General Description

The D21RB12P and D27RB12P are high-speed CMOS, dynamic random-access, 512MB registered memory modules organized in a x72 (ECC) configuration. DDR SDRAM modules use internally configured quad-bank DDR SDRAM devices.

DDR SDRAM modules use a double data rate architecture to achieve high-speed operation. The double data rate architecture is essentially a $2n$ -prefetch architecture with an interface designed to transfer two data words per clock cycle at the I/O pins. A single read or write access for the DDR SDRAM module effectively consists of a single $2n$ -bit wide, one-clock-cycle data transfer at the internal DRAM core and two corresponding n -bit wide, one-half-clock-cycle data transfers at the I/O pins.

A bidirectional data strobe (DQS) is transmitted externally, along with data, for use in data capture at the receiver. DQS is an intermittent strobe transmitted by the DDR SDRAM during READs and by the memory controller during WRITEs. DQS is edge-aligned with data for READs and center-aligned with data for WRITEs.

DDR SDRAM modules operate from a differential clock (CK and CK#); the crossing of CK going HIGH and CK# going LOW will be referred to as the positive edge of CK. Commands (address and control signals) are registered at every positive edge of CK. Input data is registered on both edges of DQS, and output data is referenced to both edges of DQS, as well as to both edges of CK.

Read and write accesses to DDR SDRAM modules are burst oriented; accesses start at a selected location and continue for a programmed number of locations in a programmed sequence. Accesses begin with the registration of an ACTIVE command, which is then followed by a READ or WRITE command. The address bits registered coincident with the ACTIVE command is used to select the device bank and row to be accessed (BA0, BA1 select device bank; A0–A12 (512MB) select device row). The address bits registered coincident with the READ or WRITE command are used to select the device bank and the starting device column location for the burst access.

DDR SDRAM modules provide for programmable read or write burst lengths of 2, 4, or 8 locations. An auto precharge function may be enabled to provide a self-timed row precharge that is initiated at the end of the burst access.

The pipelined, multibank architecture of DDR SDRAM modules allows for concurrent operation, thereby providing high effective bandwidth by hiding row precharge and activation time.

An auto refresh mode is provided, along with a power-saving power-down mode. All inputs are compatible with the JEDEC Standard for SSTL_2. All outputs are SSTL_2, Class II compatible. For more information regarding DDR SDRAM operation, refer to the 128Mb, 256Mb, 512Mb, and 1Gb DDR SDRAM component data sheets.

PLL and Registered Operation

DDR SDRAM modules operate in registered mode where the control/address input signals are latched in the register on one rising clock edge and sent to the DDR SDRAM devices on the following rising clock edge (data access is delayed by one clock). A phaselock loop (PLL) on the module is used to redrive the differential clock signals CK and CK# to the DDR SDRAM devices to minimize system clock loading.

Serial Presence- Detect Operation

These DDR SDRAM modules incorporate serial presence-detect (SPD). The SPD function is implemented using a 2,048-bit EEPROM. This nonvolatile storage device contains 256 bytes. The first 128 bytes can be programmed by the manufacturer to identify the module type and various SDRAM organizations and timing parameters. The remaining 128 bytes of storage are available for use by the customer. System READ/ WRITE operations between the master (system logic) and the slave EEPROM device (DIMM) occur via a standard I2C bus using the DIMM's SCL (clock) and SDA (data) signals, together with SA (2:0), which provide eight unique DIMM/EEPROM addresses. Write protect (WP) is tied to ground on the module, permanently disabling hardware write protect.

Mode Register Definition

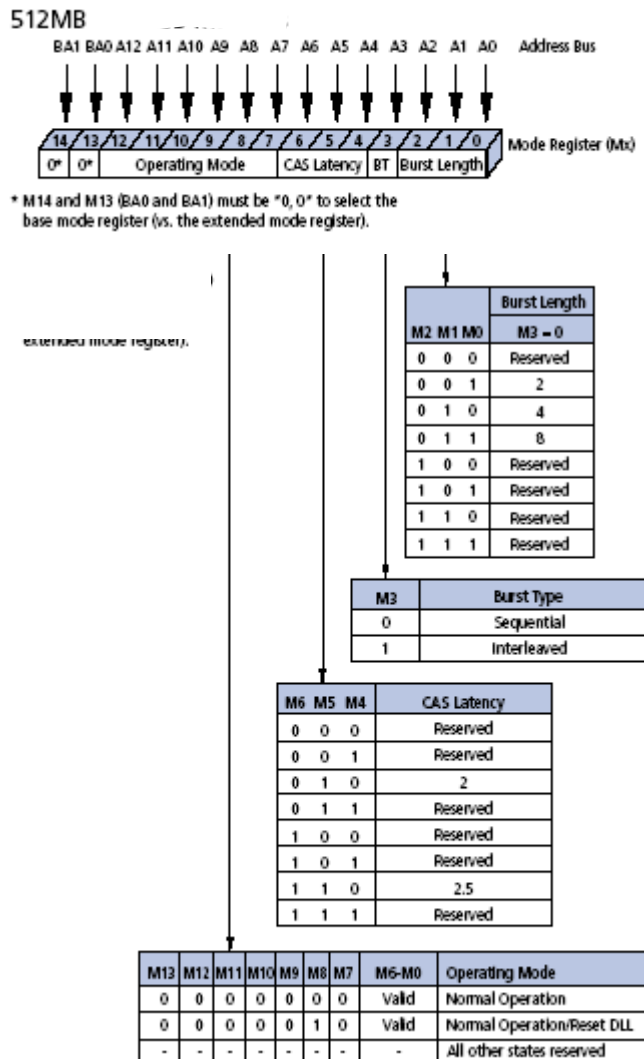

The mode register is used to define the specific mode of operation of the DDR SDRAM. This definition includes the selection of a burst length, a burst type, a CAS latency and an operating mode, as shown in Figure 5, Mode Register Definition Diagram, on page 8. The mode register is programmed via the MODE REGISTER SET command (with BA0 = 0 and BA1 = 0) and will retain the stored information until it is programmed again or the device loses power (except for bit A8, which is self-clearing).

Mode Register Definition (continued)

Reprogramming the mode register will not alter the contents of the memory, provided it is performed correctly. The mode register must be loaded (reloaded) when all device banks are idle and no bursts are in progress, and the controller must wait the specified time before initiating the subsequent operation. Violating either of these requirements will result in unspecified operation.

Mode register bits A0–A2 specify the burst length, A3 specifies the type of burst (sequential or interleaved), A4–A6 specify the CAS latency, and A7–A12 512MB specify the operating mode.

Figure 4: Mode Register Definition Diagram

Commands

Table 6 and Table 7 provide a general reference of available commands. For a more detailed description of commands and operations, refer to a DRAM manufacturer’s 256Mb, 512Mb, or 1Gb DDR SDRAM component data sheet.

Table 6: Commands Truth Table

CKE is HIGH for all commands shown except SELF REFRESH

NAME (FUNCTION)	CS#	RAS#	CAS#	WE#	ADDR	NOTES
DESELECT (NOP)	H	X	X	X	X	1
NO OPERATION (NOP)	L	H	H	H	X	1
ACTIVE (Select device bank and activate row)	L	L	H	H	Bank/Row	2
READ (Select device bank and column, and start READ burst)	L	H	L	H	Bank/Col	3
WRITE (Select device bank and column, and start WRITE burst)	L	H	L	L	Bank/Col	3
BURST TERMINATE	L	H	H	L	X	4
PRECHARGE (Deactivate row in device bank or banks)	L	L	H	L	Code	5
AUTO REFRESH or SELF REFRESH (Enter self refresh mode)	L	L	L	H	X	6, 7
LOAD MODE REGISTER	L	L	L	L	Op-Code	8

NOTE:

1. Deselect and NOP are functionally interchangeable.
2. BA0–BA1 provide device bank address and A0–A12 (512MB) provide row address.
3. BA0–BA1 provide device bank address; A0–A9 (512MB) provide column address; A10 HIGH enables the auto precharge feature (nonpersistent), and A10 LOW disables the auto precharge feature.
4. Applies only to read bursts with auto precharge disabled; this command is undefined (and should not be used) for READ bursts with auto precharge enabled and for WRITE bursts.
5. A10 LOW: BA0–BA1 determine which device bank is precharged. A10 HIGH: all device banks are precharged and BA0–BA1 are “Don’t Care.”
6. This command is AUTO REFRESH if CKE is HIGH, SELF REFRESH if CKE is LOW.
7. Internal refresh counter controls row addressing; all inputs and I/Os are “Don’t Care” except for CKE.
8. BA0–BA1 select either the mode register or the extended mode register (BA0 = 0, BA1 = 0 select the mode register; BA0 = 1, BA1 = 0 select extended mode register; other combinations of BA0–BA1 are reserved). A0–A12 (512MB) provide the op-code to be written to the selected mode register.

Table 7: DM Operation Truth Table

Used to mask write data; provided coincident with the corresponding data

NAME (FUNCTION)	DM	DQS
WRITE Enable	L	Valid
WRITE Inhibit	H	X

Figure 5: Low-Profile 184-Pin DIMM Dimensions

NOTE:

All dimensions are in inches (millimeters); $\frac{MAX}{MIN}$ or typical where noted.
